

- ・ 最初のスライド

hello, My name is morimichi kikuchi.

I work at NEC Solution inovators.

Today, my goal is to help you understand VCF 9.

So, let's get started.

First, here is a brief introduction to VCF 9.

VCF 9 was released by Broadcom in June 2025.

It is a modern private cloud product that combines the benefits of both public and private clouds.

- ・ スライド VCF9 とは？

Let me explain what kind of private cloud VCF 9 is.

VCF 9 is a packaged product that integrates compute, networking, storage, and management tools on top of vSphere.

vSphere has long been used as the de facto standard virtualization platform.

With VCF 9, developers can focus on using VMs and containers,

while administrators can manage the entire environment from a single interface.

In other words, VCF 9 simplifies both development and operations.

- ・ スライド VCF Installer

Although the explanation so far may make VCF 9 seem difficult to build, it is actually very easy.

This is because VCF 9 is deployed automatically using a deployment tool called the VCF Installer.

The person building VCF 9 only needs to enter the environment settings through the VCF Installer interface, and the environment is deployed accordingly.

By using this tool, human errors are reduced and the design phase is simplified.

As a result, the speed of design and deployment is greatly improved.

- ・ スライド Operations

Next, I will explain the features for infrastructure administrators.

With VCF 9, the entire infrastructure can be centrally managed through a single interface called VCF Operations.

it includes features for managing certificates, licenses, and passwords.

As a result, operational costs can be reduced.

- ・ スライド Automation

Finally, I will explain the features for developers.

At the beginning, I mentioned that VCF 9 can be used like a cloud.

This is enabled by VCF Automation.

Using the VCF Automation interface, developers can provision virtual machines and containers just like in a public cloud.

Although it is a private cloud, it offers key cloud benefits:

developers can use what they need, when they need it, without worrying about the underlying infrastructure.

- ・ 最終スライド

This is today's summary.

I hope you are interested in VCF 9.

Thank you for listening.
